

<b>Course code</b>																																	
<b>Type and description</b>	EC elective subjects from the discipline of Information and communication technology																																
<b>ECTS credit</b>	1																																
<b>Course name</b>	Fuzzy logic																																
<b>Course name in Polish</b>	Logika rozmyta																																
<b>Language of instruction</b>	English																																
<b>Course level</b>	8 PRK																																
<b>Course coordinator</b>	prof. dr hab inż. Adam Niewiadomski																																
<b>Course instructors</b>	prof. dr hab inż. Adam Niewiadomski

<b>Course objective</b>	To make students familiar with theory and chosen applications of fuzzy sets, with elements of theory and architecture of systems for recognition, detection, identification, interpretation, classification and representation of information.																																
<b>Learning outcomes</b>	<p>A student graduating from this course:</p> <ol style="list-style-type: none"> <li>1. DEFINES elements and basic tasks of fuzzy sets and systems.</li> <li>2. SELECTS AND DETERMINES computational methods, especially artificial intelligence methods for knowledge representations with fuzzy sets.</li> <li>3. ANALYZES AND JUDGES the choice of parameters of AI computer programs that operate on sample sets of data.</li> <li>4. PROJECTS AND PARAMETRIZES algorithms and software for fuzzy systems.</li> <li>5. ASSESSES and COMPARES performance of fuzzy systems and their methods.</li> </ol>																																
<b>Assessment methods</b>	Written and spoken evaluation of the project																																
<b>Prerequisites</b>																																	
<b>Course content with delivery methods</b>	An introduction to methods of artificial intelligence from the point of view of data representation, the Turing test. Crisp sets and multivalued sets, multivalued logics, fuzzy logic. Definitions for fuzzy sets, membership function as an extension of characteristic function. Full and partial membership. Semantic and syntactic relation to the classic set theory. Fuzzy relations and their properties, examples. Reflexive, transitive, symmetric and locally reflexive fuzzy relations. Similarity relations, neighbourhood relations, fuzzy equivalence and fuzzy equality, Poincare's paradox. Basic characteristics of fuzzy sets: support, cardinality, alpha-cuts, kernel. Triangular norms, intersection, union and complement of fuzzy sets. Linguistic variables, modifiers `very' and `more-or-less'. The connectives OR, AND, NOT. Fuzzy quantifiers, relative and absolute. Properties of fuzzy quantifiers. General and existential quantifier as fuzzy quantifiers. Linguistically quantified statements, degrees of truth. Linguistic summaries of databases by Yager. Elements of a summary, degree of truth. Compound summarizers, qualifiers. Quality measures of summaries. The optimal summary. Interval-valued fuzzy sets and type-2 fuzzy sets as extensions of Zadeh's fuzzy sets. Interval-valued and type-2 linguistic summaries.
